Haven User Flow and Architecture

Oct 19, 2026 · @Athar Ali

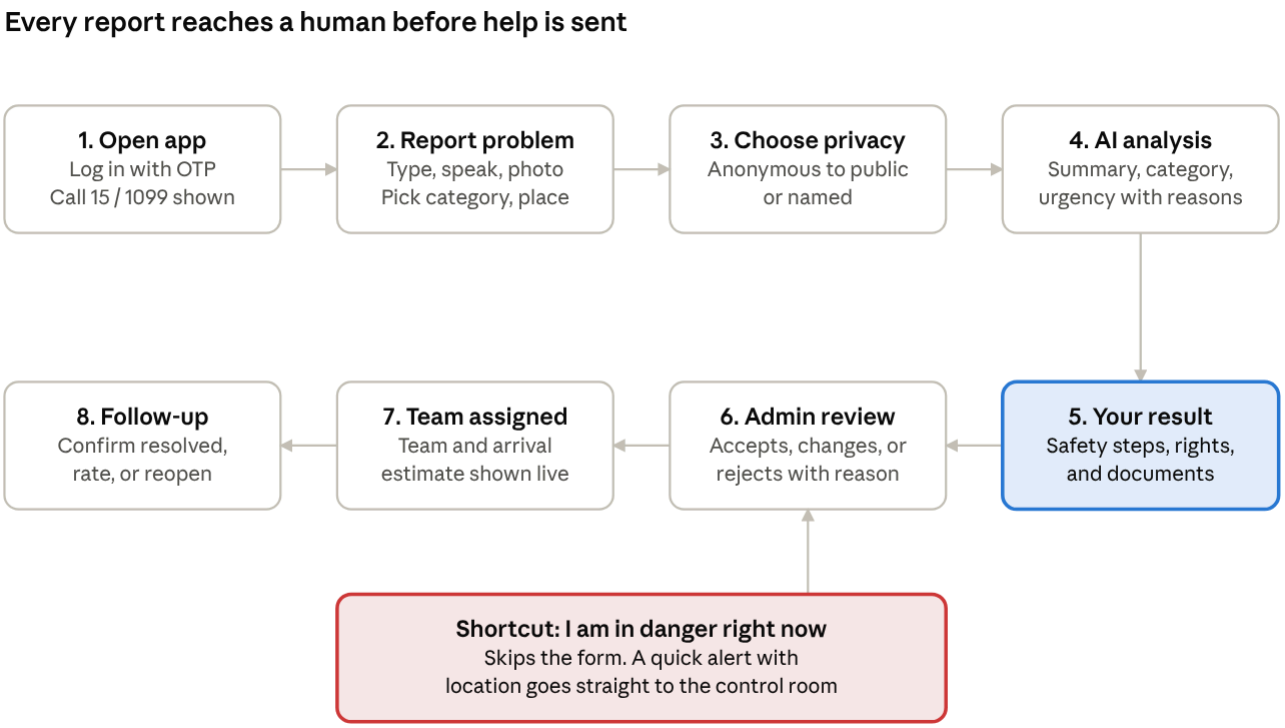

System architecture

system architecture · 2 apps, 1 API, 3 services

The citizen and admin apps both call the API. The API checks roles, runs the AI pipeline, and talks to Supabase, Gemini, and the SMS provider. The apps also use Supabase directly for login and live updates.

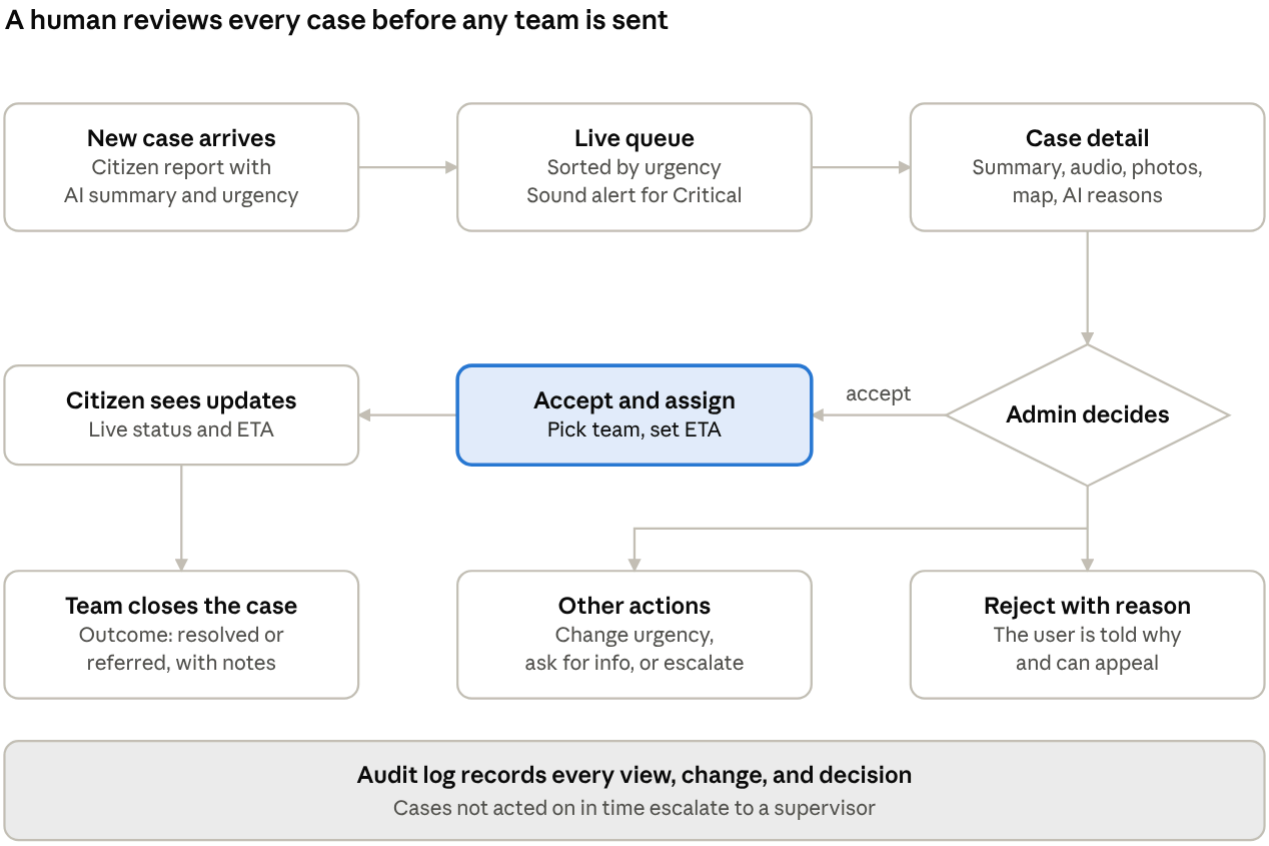

Citizen flow

citizen flow · 8 steps and 1 shortcut

Read the top row left to right, then the bottom row right to left. The shortcut is a button on the home screen and skips the form. Civic complaints follow the same steps but end in a department and a tracking number.

Control room flow

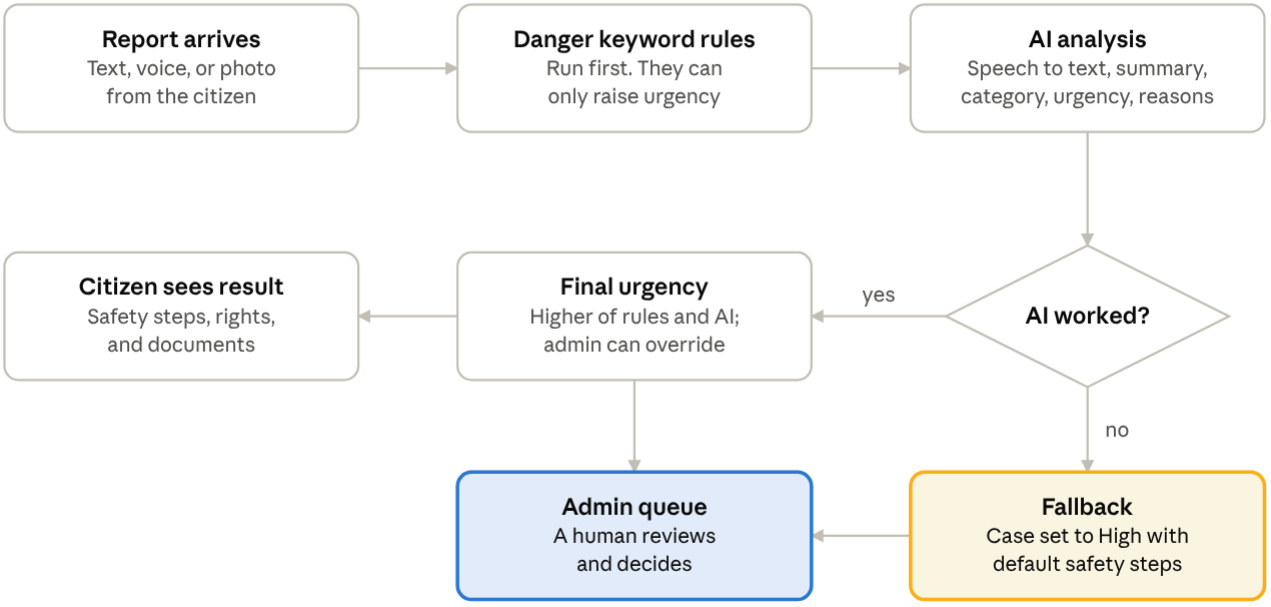

control room flow · 1 decision, 4 outcomes

The admin can accept, reject, or use other actions. Only an accepted case gets a team. Every step is logged.

AI pipeline and fallback

If the AI fails, the case still reaches a human as High

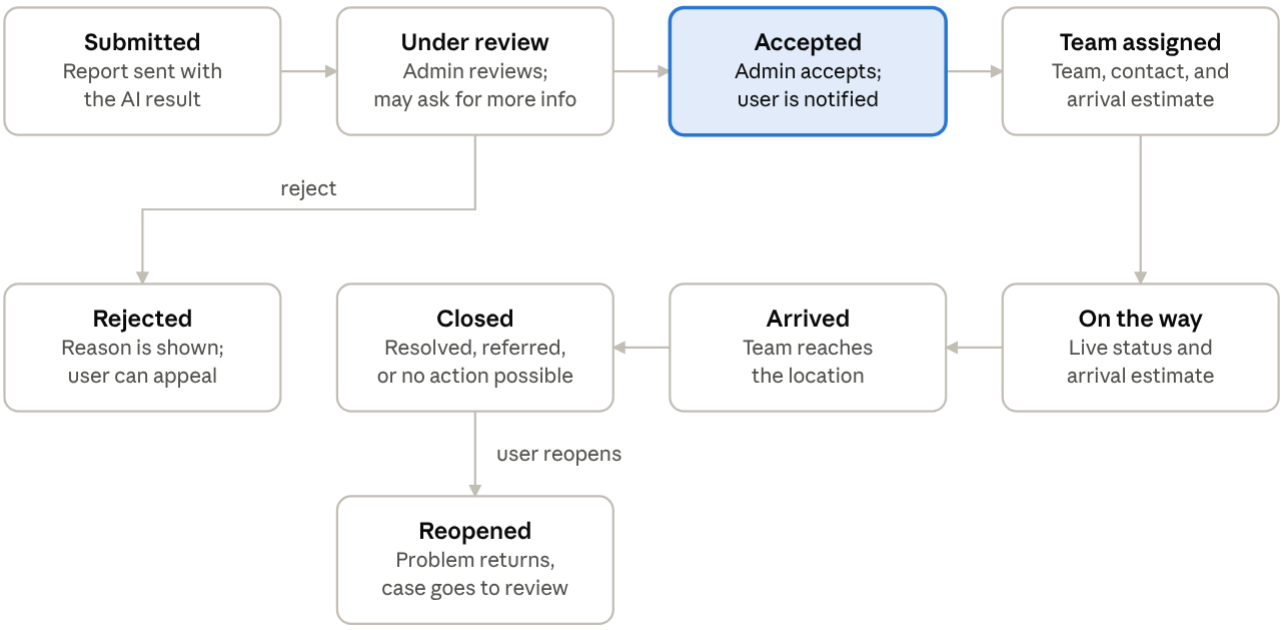

AI pipeline and fallback · 1 decision

Danger rules run before the AI and can only raise urgency. If the AI is unsure, the case is marked for human review. Call 15 and Call 1099 stay visible in every case.

Case status lifecycle

A case moves from Submitted to Closed and can be reopened

case status lifecycle · 9 statuses

The top row runs left to right, then the middle row runs right to left. The user sees Accepted, Team assigned, On the way, and Arrived as live updates. Civic cases skip the team steps and go to a department with a tracking number.
